

2016 Supplemental Summary

Statewide Regional Evacuation Study

GLADES COUNTY APPENDIX

This document contains summaries (updated in 2016) of the following chapters of the 2010 Volume One, Technical Data Report:

Chapter 1: Regional Demographics

Chapter 2: Regional Hazards Analysis

Chapter 4: Regional Vulnerability & Population Analysis

Funding Provided by the Florida Division
of Emergency Management

Work completed by the Southwest
Florida Regional Planning Council

A. Introduction

This appendix provides a County Demographic Profile, Vulnerability Profile and a more detailed vulnerability analysis of critical facilities and corresponding maps.

B. County Small Area Data

Small Area Data is used with the Regional Transportation Evacuation Model. The data is gathered for two time periods – 2015 and 2020. This data is centered on housing units and provides for the number of site built and mobile homes in each County. The maps below depict the density of both site built homes in Glades County and mobile homes in the County.

Table B1: Glades County Small Area Data

	2015	2020
Total Dwelling Unit Site-Built Homes	2,934	3,093
Occupied Site-Built Homes	2,128	2,245
Population in Site-Built Homes	5,186	5,443
Vehicles in Site-Built Homes	3,734	3,937
Total Dwelling Unit Mobile Homes	4,123	4,347
Occupied Mobile Homes	2,455	2,587
Population in Mobile Homes	6,343	6,712
Vehicles in Mobile Homes	4,316	4,548
Population in Hotel-Motel Units	297	428
Vehicles in Hotel-Motel Units	122	177

C. County Demographic Trends

This section of the report, and the data contained herein, is provided to capture a profile of the county including population **trends** not previously discussed in the regional demographics overview. The County Profiles are compiled by Florida Department of Transportation and can be found online at <https://etdmpub.flh-dot.org/est/>

County Demographic Profile

Glades

Area: 985.951 square miles
Jurisdiction(s): Cities: Labelle, Clewiston, Moore Haven

E. County Hazard Maps

The Regional Evacuation Study includes not only an analysis of Storm Surge, but FEMA defined Flood Zones as well as the Wildfire Risk in each County.

Storm Surge

Storm surge is the abnormal rise in water level caused by the wind and pressure forces of a hurricane or tropical storm. Storm surge produces most of the flood damage and drowning associated with storms that make landfall or that closely approach the coastline. Of the hurricane hazards, the storm surge is considered the most dangerous as nine out of ten hurricane-related deaths are caused by drowning. The County storm surge zones and evacuation zones can be found in the maps below.

Freshwater Flooding and the Inundation of Evacuation Routes

Inland Riverine and freshwater flooding often becomes a significant factor as a result of tropical storms and hurricanes. Unlike storm surge, the rainfall associated with, and in advance of, a hurricane does not necessitate the emergency evacuation of residents during the passage of a hurricane. Following a storm, however, the coastal flooding and rainfall – particularly from slow moving storms - necessitates an evacuation of flooded inland residents days after, as swollen rivers and streams breach their banks or levees.

Regarding hurricane evacuation, however, rainfall may cause the early inundation of roadways sought as evacuation routes by vehicles attempting to escape from areas vulnerable to the approaching storm surge. In addition, given Florida climatology and the normal summer weather, flooding may occur as a disassociated event prior to the hurricane, flooding evacuation routes, and saturating the ground. FEMA defined Flood Zones are presented below.

0.4 0.8 1.7 2.55 3.4
Miles

This map is prepared under the direction of Florida Division of Emergency Management for the Regional Evacuation Study Update. This map is for planning purposes only. Not to be used for measurement or legal purposes. Please consult with your county for the latest information.

Rainwater inundation of evacuation routes must be addressed in an evacuation plan. The planning strategy to address this problem is to plan for the passage of all vehicles over such roadways before substantial rainfall from the hurricane was expected to arrive. Hourly records of rainfall rates and accumulation for past hurricanes indicate that rates high enough to surpass drainage capabilities normally parallel in time the arrival of sustained tropical storm-force winds. Utilizing this as an assumption of the timing of freshwater roadway inundation, the pre-landfall hazards time quantification for sustained tropical storm-force winds will also compensate for early rainfall inundation of evacuation routes.

Those roadways known historically to be vulnerable from freshwater flooding have been identified by the county and municipal emergency management/law enforcement/ emergency response personnel. These routes, including those which were inundated or forced to close during recent flooding events or are within a 100 Year Flood Plain as identified by FEMA, are presented in a map below.

2016 Evacuation Study Summary Update

Wildfire

In the last decade, there have been on average 3,361 wildfires a year throughout the State of Florida (Florida Forest Service, 2011). Although fire is a naturally occurring element in Florida ecosystems, the continued development of housing and infrastructure within wildland areas and forests presents a wildfire hazard that will continue to escalate as residential development continues to encroach on natural areas.

Glades County

Wildfire Level of Concern

2016 Evacuation Study Summary Update

F. Critical Facilities Analysis

Since the release of the original Regional Evacuation Study Program as part of the statewide update in 2010, the Florida Division of Emergency Management (FDEM) has maintained a critical facilities database for the entire State. FDEM coordinates the update and maintenance of this data.

The Critical Facility Inventory (Data base) includes a comprehensive list of critical facilities identified by the State and County Emergency Management Agencies. This inventory is not published as part of the report. However, selected facilities which may require evacuation or mitigation are identified in the tables and maps which follow. The tables indicate vulnerability from storm surge (based on the SLOSH model), location in an Evacuation Zone, freshwater flooding (based on the FEMA Flood Maps) and wildfire (Wildfire Interface/Levels of Concern).
